

RAMBOLL

LABORATORY TECHNOLOGY

Ramboll's Pharma department offers highly qualified specialists with extensive technical knowledge and expertise of projects for the pharmaceutical industry.

Active consultation & advisory service

For more than three decades Ramboll has consulted with many of the leading pharmaceutical companies in Denmark. Our knowledge and vast experience enables us to give the client qualified advisory service and consultancy. Our experience within laboratory technology construction ranges from registration and assessment of existing facilities to smaller refurbishments to large new buildings.

Competencies

Today, we offer our clients competencies covering all types of laboratories from chemical analyses, biochemical analyses, pharmacological analyses over cellular cultivation to facilities for laboratory animals. Across different types of laboratories our know-how covers classification of isotopes or GMO/BSL in different categories.

The client's requirements

Prior to client decision on whether

revamping or establishing new laboratory facilities, it is important to analyse and define the requirements. Ramboll has the right know-how of processes, equipment and working procedures which enables us to transform these requirements into robust possible solutions.

Good working environment

When Ramboll plans and designs laboratories, the issues of the working environment and animal welfare are important issues to be handled the best way possible. Layout and design of fume cupboards, LAF benches and the like shall be planned so as to prevent the influence of harmful substances of the personnel, as well as avoid contamination and allergies.

Project management

Planning, design, tendering and management of the construction works, with both development and rebuilding takes place in close cooperation with the client and users/stakeholders. The best results

are obtained when we combine the knowledge of the client and the experience of Ramboll. We place great emphasis on strict control of quality, time and economy during the execution of the task in order to comply with the preconditions, and allowing to maximise emphasis on the production.

Interdisciplinary cooperations

At Ramboll we work actively with knowledge sharing from project to project, constantly timetuning the quality of our delivery. This is beneficial to the clients, the quality and the economy. We place great emphasis on assembling a project team, which is continuous throughout the project in order to ensure that essential knowledge during the implementation of the next phase is not lost.
